

Stock Analysis Using Natural Language Processing

Group 5 - Bryan Arciniega, Jacob Reyes,
Tristan S, Harper Van, Anas Alakkad,
Andrew D

Objectives

Our goal for this project is to use sentiment analysis in order to determine whether a stock has bearish or bullish outlook and then use this knowledge to successfully execute stock trades for profit.

Tools for Implementation

- Python
- PyTorch
- BERT

- Jupyter Notebook
- Colab's GPU

- Twitter
- Tweepy API

- Alpaca API

Pipeline Structure

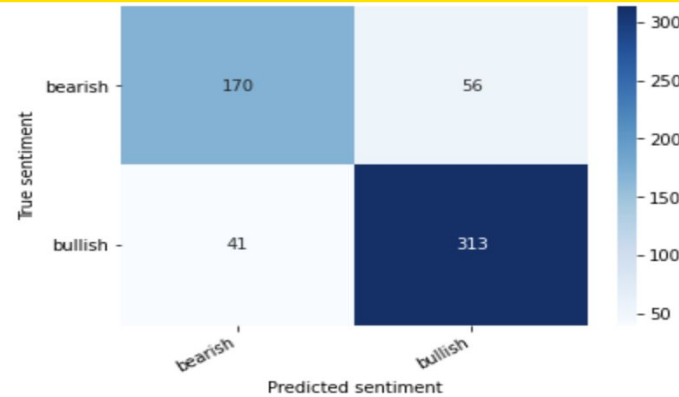

BERT

Kaggle Data Set

X	Y
"AAPL, LOOKING GOOD"	1 (BULLISH)
"AMZN, APPROACHING A BUBBLE"	0 (BEARISH)

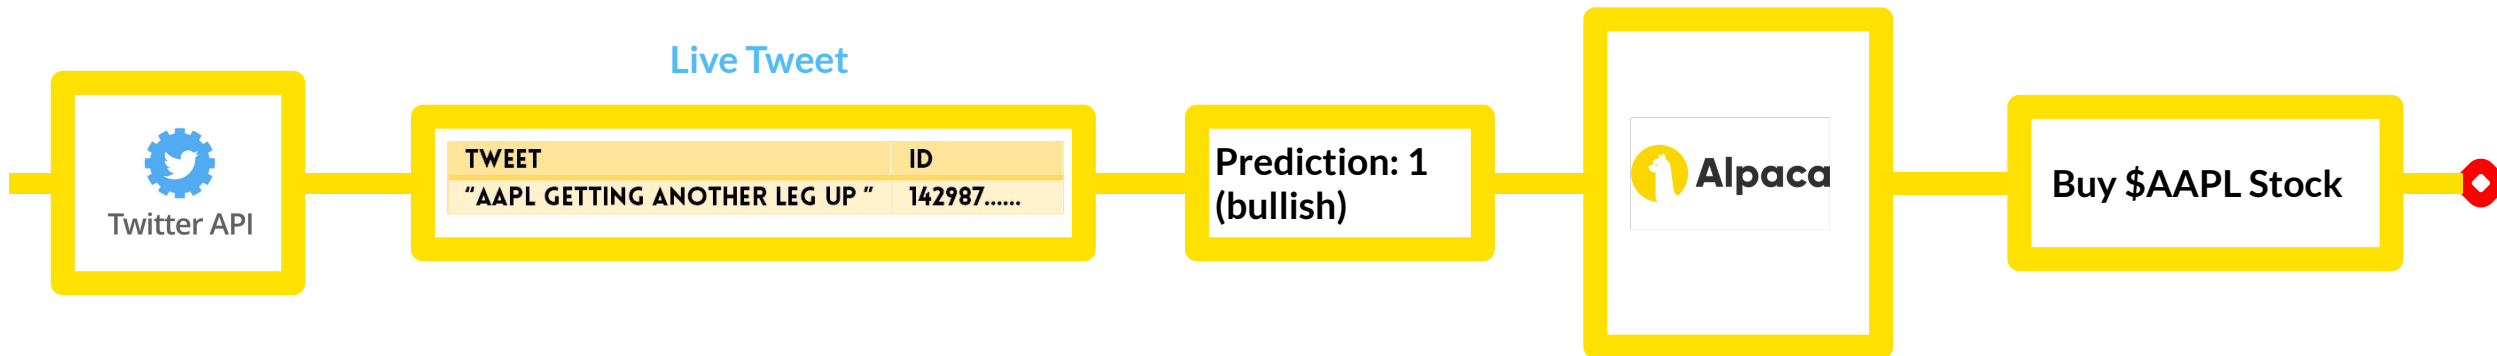

Model Prediction

Cont'd...

Twitter

- We are using the twitter API in order to pull specific tweets related to stocks
- We had to create a twitter account and request developer access to their API
- By using hashtags and pulling from specific investing accounts we are able to get a decent consensus on the sentiment towards specific stocks outlook.

Sentiment Analysis

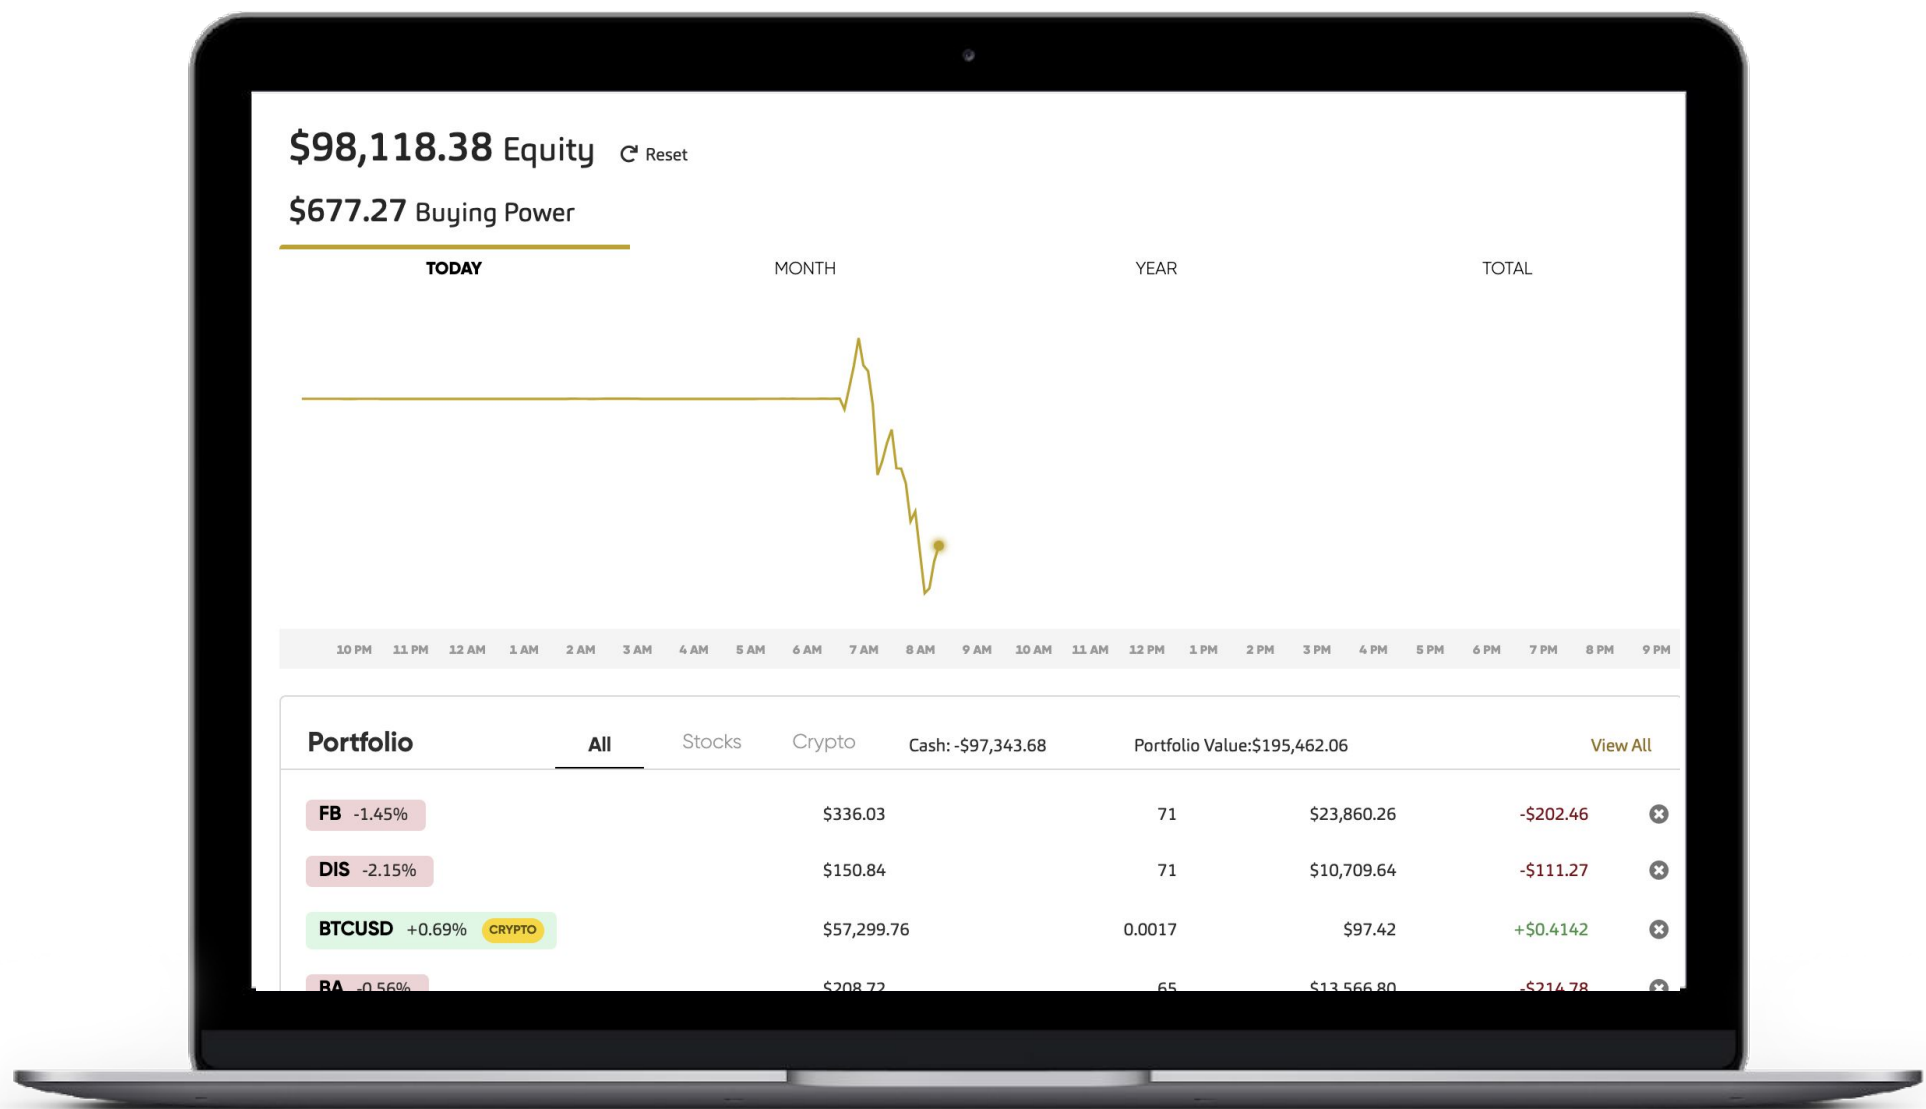

- The sentiment analysis code was written in python using the helpful NLTK library. (Natural Language Toolkit)
- The tweets were first cleaned up by removing unnecessary symbols and numbers.
- We then labeled a set of tweets and used them to train the model
- Each tweet that was pulled would then be ran through the model and determine whether there was a positive or negative sentiment

Stock Trading

- Once the sentiment is determined the sentiment and stock ticker is sent to an algorithm that sends an API call to a paper trading stock API that is able to either buy or sell the stock depending on the sentiment calculated.
- The paper trading stock API is called Alpaca which can track your live portfolio performance
